Self-Cleaning Filters Improve Maintenance Cycles

Unit:	(3) Solar Saturn Turbines
Use:	Pipeline – Compressor Station
Location:	Tennessee
Requirements:	Decrease required maintenance by extending life of air filter media.

McGuffy Energy provided the MPC-24 (McGuffy Pulse Clean) for three of the client’s Solar Saturn turbine units. These units use a reverse blast of air through the filter media to dislodge gathered particles which then fall to the ground; this extends the life of the filter media. McGuffy Energy also manufactured and installed the exhaust systems for this station.
